Today's presentation

- Introduce evidence-based assessment
- Highlight a biodiversity example
- Explore potential for biosecurity/pest management
- Discuss ideas, suggestions, feedback, research collaboration

Better biosecurity better outcomes

- Biosecurity/pest management delivers multiple positive outcomes (end results)
 - Biodiversity -- more native species
 - Biodiversity -- more productive farms
 - Access to markets
 - Human health
 - Etc, etc.

Confidence in outcomes?

- How can we be more confident that management actions will lead to certain outcomes?
- What evidence is there? How reliable? How much?
- How to quantify results of what's being done on farms or elsewhere?

Use an evidence-based tool

- Evidence database
 - Line of sight between action and outcome
- Cool Farm Biodiversity Tool --
 - Online calculator of biodiversity effects
 - For Europe and US
 - NZSD adapting for New Zealand
 - Option -- include a biosecurity component?
 - Would it be a useful tool?
- Need input from users/stakeholders

Conservation Evidence Database

Search our free summaries of scientific information to help make your conservation decisions more effective

Browse by category:

 <p>Amphibian Conservation 129 Actions</p>	 <p>Bat Conservation 78 Actions</p>	 <p>Bee Conservation 59 Actions</p>
 <p>Bird Conservation 455 Actions</p>	 <p>Control of Freshwater Invasive Species 139 Actions</p>	 <p>Farmland Conservation 119 Actions</p>

- 1000s peer reviewed articles on “what works”

How it works

- 30 yes/no questions (mostly)
- Scoring is evidence-based, data accessible
- Actions with high quality evidence from many studies get extra points
- Actions with less evidence get fewer points

For example:

- What evidence for effects of 5% RTC vs 1%?
- How widely accessible is that evidence?

Biodiversity assessment

Name: Kevin's bach

General scores, per-component

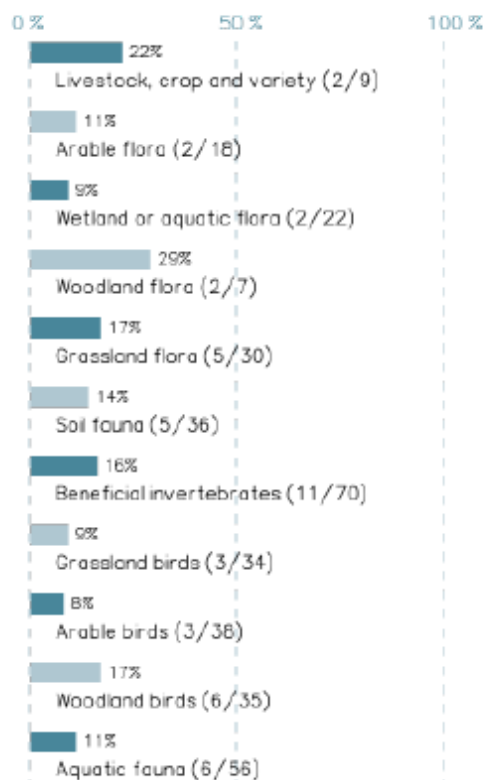

Farmed products: 24%

Farming practices: 28%

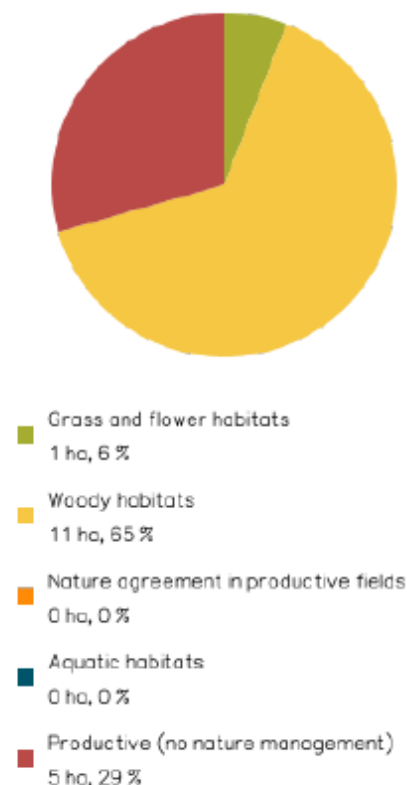

Small habitats: 12%

Large habitats: 29%

Species group scores

Land use

Tool's strengths

- International experience to draw on
- Evidence based; builds confidence
- Transparent, balanced, repeatable
- Easy to use
- Can incorporate many actions
- Continued improvement with new evidence, new research & technologies

Adaptations needed for NZ

- Evaluate existing evidence for NZ context
- Need to include special features of NZ ecology & identity
 - Pests!
- Trade-offs between the environmental outcomes of different management
 - Stream fencing -- water quality vs weed corridors

Other issues

- Currently, CFT ignores species origin (indigenous vs introduced)
 - “weeds” that are indigenous plants
- Ecosystem services (e.g. pollination on farms) depend on introduced species
- How can data be used and by whom?
 - Not just a biodiversity/biosecurity issue

Dashboard research plan

- Get stakeholder/user feedback!
- Identify missing relevant sectors and biomes
- Align to NZ priorities
- Better align the tool to NZSD
- Re-evaluate evidence scores in the NZ context
- Trial app as a proof-of-concept

Pest management evidence-based tool?

- Underlying design of the biodiversity tool readily transferable to biosecurity issues
- How valuable? Is there a need?
- What biosecurity issues to prioritise?
- Who is the target market?
 - Farmers managing agricultural weeds?
 - Groups doing in predator control?
 - Councils measuring RPMP effectiveness?
- That's why I'm here today

Thank you

Thanks to co-authors Catriona and Angela!

Questions?

R & D: Phase 1

- Seeking stakeholder engagement from multiple sectors & scales of reporting
 - Industry sectors at regional & national level
 - Government agencies & nonprofits
- Identify sustainability priorities & needs of stakeholders
 - Form & aspects of tool that would be most useful
 - Meet both government & industry reporting needs
- Begin to re-evaluate tool in NZ context

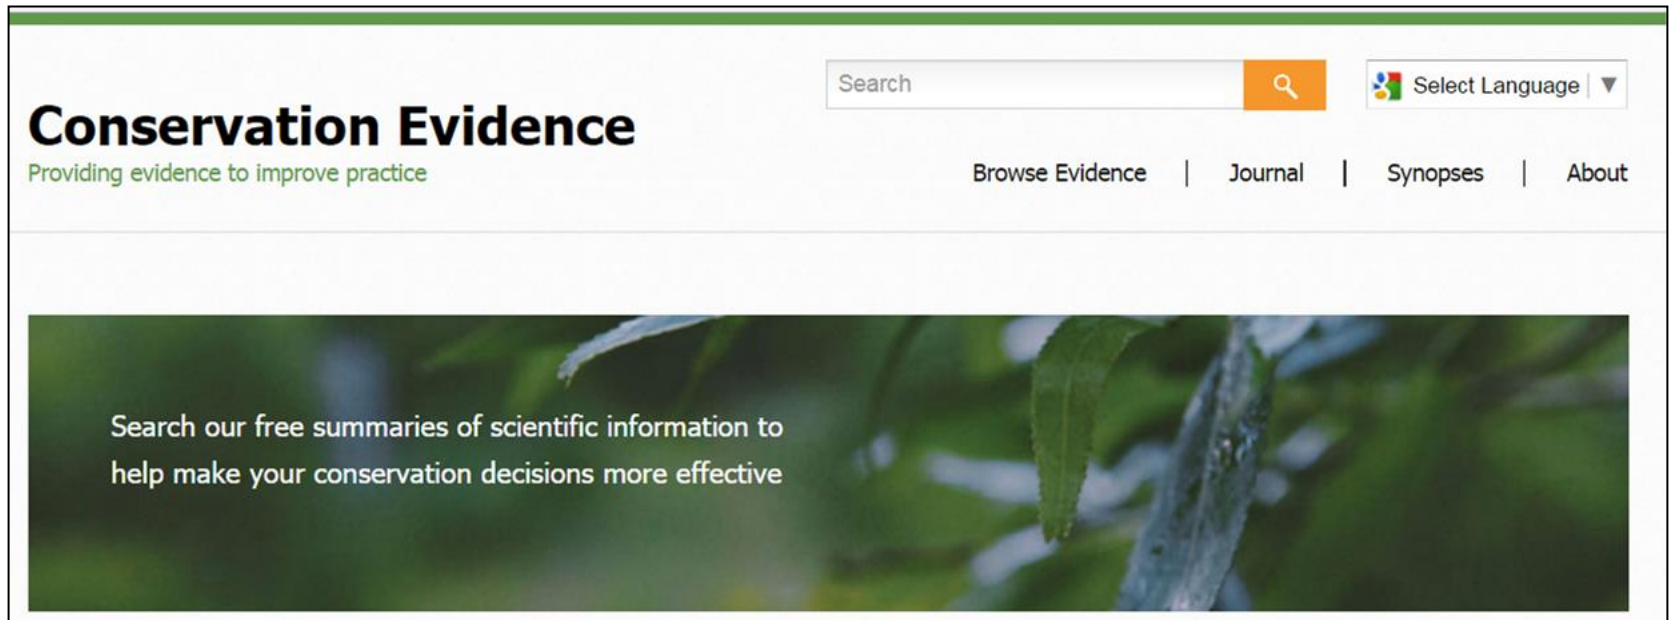

Your feedback

- Form & aspects of tool:
 - Interest from farmers and councils?
 - Which pest management actions to incorporate?
 - Which farm practices are key?
 - Evidence database for NZ
 - Breadth of scope (nationwide vs sector focus)
 - Aid with specific research objectives

Tool's strengths: Evidence

Expert panel assessment

Incorporate evidence into biodiversity tool

Tool development plan

- Research & development: phase 1
 - Proof-of-concept with stakeholder endorsement
 - Within next 18 months
- Research & development: phase 2
 - Focussed research objectives guided by form of tool desired by stakeholders
- Implementation
 - In collaboration with Cool Farm Alliance
